# Reports

For years after graduating from medical school, Dr. Clifton K. Meador assumed that symptoms of the body, when obviously not imaginary, indicate a disease of the body—something to be treated with drugs, surgery, or other traditional means. But, over several decades, as he saw patients with clear symptoms but no discernable disease, he concluded that his own assumptions were too narrow and, indeed, that the underlying basis for much of clinical medicine was severely limited. Recounting a series of fascinating case studies, Meador shows in this book how he came to reject a strict adherence to the prevailing biomolecular model of disease and its separation of mind and body. He studied other theories and approaches—George Engel's biopsychosocial model of disease, Michael Balint's study of physicians as pharmacological agents—and adjusted his practice accordingly to treat what he called "nondisease." He had to retool, learn new and more in-depth interviewing and listening techniques, and undergo what Balint termed a "slight but significant change in personality." In chapters like "The Woman Who Believed She Was a Man" and "The Diarrhea of Agnes," Meador reveals both the considerable harm that can result from wrong diagnoses of nonexistent diseases and the methods he developed to help patients with chronic symptoms not defined by a medical disease. Throughout the book, he recommends subsequent studies to test his observations, and he urges full application of the

scientific method to the doctor-patient relationship, pointing out that few objective studies of these all-important interactions have ever been done.

What is good bedside manner? How do you tell patients they have a terminal illness? What do you do after you have told them? How do you deal with the family after a patient dies? How do you foster good relationships with patients, nurses and other physicians? How do you avoid burnout? Your answers to these and similar questions will prove crucial to your medical career. Yet during my seven years of medical school and residency, these issues were never mentioned, much less dealt with. Some programs are now making efforts to teach the human side of medicine, but medical training today is not much different from mine. I intended Medicine with a Human Touch to be a guide for medical students and residents in dealing with these and similar non-technical problems. Yet numerous practicing physicians who reviewed it remarked that we would all do well to reexamine periodically how we are behaving in our everyday practice.
