The Chemistry of Heterocyclic Compounds, since its inception, has been recognized as a cornerstone of heterocyclic chemistry. Each volume attempts to discuss all aspects - properties, synthesis, reactions, physiological and industrial significance - of a specific ring system. To keep the series up-to-date, supplementary volumes covering the recent literature on each individual ring system have been published. Many ring systems (such as pyridines and oxazoles) are treated in distinct books, each consisting of separate volumes or parts dealing with different individual topics. With all authors are recognized authorities, the Chemistry of Heterocyclic Chemistry is considered worldwide as the indispensable resource for organic, bioorganic, and medicinal chemists.

This major reference work is arranged like an encyclopedia, with each entry providing information about a reagent which has been reported as useful in organic synthesis. Most of the reagents are themselves organic, but inorganic reagents are also included. Suppliers are listed for commercially available reagents; otherwise, a brief indication of the method of preparation is given, along with a literature reference. Concise information and literature references are also provided on the application of reagents. There are author and subject indexes, and a very useful index of reagents by type, so that this reference set can serve as a very convenient point of entry into the literature dealing with a general type of reaction, whether it be a "name" reaction (e.g., Baeyer-Villiger oxidation), a method of introducing a specific functional group (e.g., amination), etc.

Software Engineering Volume 2: The Supporting Processes Third Edition Richard H. Thayer and Merlin Dorfman Foreword by Leonard L. Tripp, 1999 President of the IEEE Computer Society This second volume of the Software Engineering tutorial, Third Edition includes reprinted and newly authored papers that describe the software engineering supporting life cycle processes. This volume details the supporting life cycle processes that developers need to employ and execute in the engineering of software products. This required support plays an integral part and has a distinct purpose that affects the overall success and quality of the software project. This book helps prepare individuals to take the examination required by the IEEE Computer Society to achieve the status of Certified Software Development Professional (described at [www.computer.org/certification](http://www.computer.org/certification)). This Third Edition differs from the earlier editions in that it supports both the new 2004 version as well as the older 2001 version of the Software Engineering Body of Knowledge (SWEBOK), and that many of the newly authored papers were tailored after and support the corresponding chapter from SWEBOK 2004. In fact, some of the authors of the tailored papers also wrote the corresponding SWEBOK 2004 knowledge area. The supporting processes covered in this book include documentation, configuration management, quality assurance, verification and

validation, and review and audit processes. In addition, this tutorial covers the four processes of the organizational life cycle. These are used to establish and implement an underlying structure made up of associated life cycle processes and personnel that will continuously improve upon the structure and process of the project. These organizational processes are management, infrastructure, improvement, and training. Each chapter in this volume starts by introducing the subject, supporting papers, and standards. The backbone for this publication is IEEE/EIA Standard 12207-1997, Standard for Information Technology—Software Life Cycle Processes. Contents: Software Engineering Supporting Processes Software Configuration Management Software Verification and Validation Processes Software Quality Assurance Process Software Reviews and Audits Processes Software Documentation Process Management Process Infrastructure Process Improvement and Training Processes Appendices

The amount of algebraic topology a graduate student specializing in topology must learn can be intimidating. Moreover, by their second year of graduate studies, students must make the transition from understanding simple proofs line-by-line to understanding the overall structure of proofs of difficult theorems. To help students make this transition, the material in this book is presented in an increasingly sophisticated manner. It is intended to bridge the gap between algebraic and geometric topology, both by providing the algebraic tools that a geometric topologist needs and by concentrating on those areas of algebraic topology that are geometrically motivated. Prerequisites for using this book include basic set-theoretic topology, the definition of CW-complexes, some knowledge of the fundamental group/covering space theory, and the construction of singular homology. Most of this material is briefly reviewed at the beginning of the book. The topics discussed by the authors include typical material for first- and second-year graduate courses. The core of the exposition consists of chapters on homotopy groups and on spectral sequences. There is also material that would interest students of geometric topology (homology with local coefficients and obstruction theory) and algebraic topology (spectra and generalized homology), as well as preparation for more advanced topics such as algebraic  $K$ -theory and the  $s$ -cobordism theorem. A unique feature of the book is the inclusion, at the end of each chapter, of several projects that require students to present proofs of substantial theorems and to write notes accompanying their explanations. Working on these projects allows students to grapple with the "big picture", teaches them

how to give mathematical lectures, and prepares them for participating in research seminars. The book is designed as a textbook for graduate students studying algebraic and geometric topology and homotopy theory. It will also be useful for students from other fields such as differential geometry, algebraic geometry, and homological algebra. The exposition in the text is clear; special cases are presented over complex general statements.

"Environmentally Conscious Design has become a major interest of architects, designers, planners, public officials, and industry leaders around the world. Unlike other books on the subject that focus on only one or another aspect of ecological design, The Ecology of Architecture answers the question, How do we design and build ecologically sound and affordable structures today that will perform well tomorrow? Written by an experienced practitioner in the field, the book details all facets of green building by providing comparative energy performance solutions, recycling alternatives, cost considerations, materials analyses, information on legislation, as well as examples of practical applications."--BOOK JACKET.Title Summary field provided by Blackwell North America, Inc. Presenting the state of the art in component-based software testing, this cutting-edge resource offers you an in-depth understanding of the current issues, challenges, needs and solutions in this critical area. The book discusses the very latest advances in component-based testing and quality assurance in an accessible tutorial format, making the material easy to comprehend and benefit from no matter what your professional level. important, and how it differs from traditional software testing. From an introduction to software components, testing component-based software and validation methods for software components, to performance testing and measurement, standards and certification and verification of quality for component-based systems, you get a revealing snapshot of the key developments in this area, including important research findings. This volume also serves as a textbook for related courses at the advanced undergraduate or graduate level.

Organometallic chemistry is an interdisciplinary science which continues to grow at a rapid pace. Although there is continued interest in synthetic and structural studies the last decade has seen a growing interest in the potential of organometallic chemistry to provide answers to problems in catalysis synthetic organic chemistry and also in the development of new materials. This Specialist Periodical Report aims to reflect these current interests reviewing progress in theoretical organometallic chemistry, main group chemistry, the lanthanides and all aspects of transition metal chemistry. Specialist Periodical Reports provide systematic and detailed review coverage of progress in the major areas of chemical research. Written by experts in their specialist fields the series creates a unique service for the active research chemist, supplying regular critical in-depth accounts of progress in particular areas of chemistry. For over 80 years the Royal Society of Chemistry and its predecessor, the Chemical Society, have been publishing reports charting developments in chemistry, which originally took the form of Annual Reports. However, by 1967 the whole spectrum of chemistry could no longer be contained within one volume and the series Specialist Periodical Reports was born. The Annual Reports themselves still existed but were divided into two, and subsequently three, volumes covering Inorganic, Organic and Physical Chemistry. For more general coverage of the highlights in chemistry they remain a 'must'. Since that time the SPR series has altered according to the fluctuating degree of activity in various fields of chemistry. Some titles have remained unchanged, while others have altered their emphasis along with their

titles; some have been combined under a new name whereas others have had to be discontinued. The current list of Specialist Periodical Reports can be seen on the inside flap of this volume.
