This comprehensive new book, *Agricultural Health and Safety*, provides extensive coverage of issues arising in the interrelated fields of health, agriculture, and the environment. The significance of this book is a direct result of the increasing number of health and safety issues in agriculture and its associated industries. It contains sections written by experts, and includes papers presented at the Third International Symposium for Issues in Health, Agriculture and the Environment. Topics include lung disease in farmers, respiratory effects of long-term exposure to grain dust and air contaminants, respiratory hazards of pork producers, occupational asthma, allergic disorders in plant growers, allergic rhinitis in farmers, respiratory effects of inhaled endotoxins, organic dust toxic syndrome, cancer risks, hazards of pesticides, neurological risks, work-related accidents, prevention and safe practice, sustainable farming systems, and more. In all cases, the issues are broadly integrated with those of the environment. No other book presents such a broad perspective of the field.

The health and environmental impacts of the pesticides used in hi-tech agriculture are increasingly under scrutiny. This work brings together the experience and findings of scientists, farmer's organizations, researchers and activists involved in monitoring the development and marketing of pesticides, dialoguing with manufacturers, and campaigning for tighter controls and more bio-friendly approaches.

Throughout much of its history, the United States was predominantly a rural society. The need to provide sustenance resulted in many people settling in areas where food could be raised for their families. Over the past century, however, a quiet shift from a rural to an urban society occurred, such that by 1920, for the first time, more members of our society lived in urban regions than in rural ones. This was made possible by changing agricultural practices. No longer must individuals raise their own food, and the number of person-hours and acreage required to produce food has steadily been decreasing because of technological advances, according to Roundtable member James Merchant of the University of Iowa. The Institute of Medicine's Roundtable on Environmental Health Science, Research, and Medicine held a regional workshop at the University of Iowa on November 29 and 30, 2004, to look at rural environmental health issues. Iowa, with its expanse of rural land area, growing agribusiness, aging population, and increasing immigrant population, provided an opportunity to explore environmental health in a region of the country that is not as densely populated. As many workshop participants agreed, the shifting agricultural practices as the country progresses from family operations to large-scale corporate farms will have impacts on environmental health. This report describes and summarizes the participants' presentations to the Roundtable members and the discussions that the members had with the
