Drawing the Map of Life is the dramatic story of the Human Genome Project from its origins, through the race to order the 3

billion subunits of DNA, to the surprises emerging as scientists seek to exploit the molecule of heredity. It's the first account to deal in depth with the intellectual roots of the project, the motivations that drove it, and the hype that often masked genuine triumphs. Distinguished science journalist Victor McElheny offers vivid, insightful profiles of key people, such as David Botstein, Eric Lander, Francis Collins, James Watson, Michael Hunkapiller, and Craig Venter. McElheny also shows that the Human Genome Project is a striking example of how new techniques (such as restriction enzymes and sequencing methods) often arrive first, shaping the questions scientists then ask. Drawing on years of original interviews and reporting in the inner circles of biological science, *Drawing the Map of Life* is the definitive, up-to-date story of today's greatest scientific quest. No one who wishes to understand genome mapping and how it is transforming our lives can afford to miss this book.

Charming and classically handsome, John Gilbert (1897--1936) was among the world's most recognizable actors during the silent era. He was a wild, swashbuckling figure on screen and off, and accounts of his life have focused on his high-profile romances with Greta Garbo and Marlene Dietrich, his legendary conflicts with Louis B. Mayer, his four tumultuous marriages, and his swift decline after the introduction of talkies. A dramatic and interesting personality, Gilbert served as one of the primary inspirations for the character of George Valentin in the Academy Award--winning movie *The Artist* (2011). Many myths have developed around the larger-than-life star in the eighty years since his untimely death, but this definitive biography sets the record straight. Eve Golden separates fact from fiction in *John Gilbert: The Last of the Silent Film Stars*, tracing the actor's life from his youth spent traveling with his mother in acting troupes to the peak of fame at MGM, where he starred opposite Mae Murray, Norma Shearer, Joan Crawford, Greta Garbo, and other actresses in popular films such as *The Merry Widow* (1925), *The Big Parade* (1925), *Flesh and the Devil* (1926), and *Love* (1927). Golden debunks some of the most pernicious rumors about the actor, including the oft-repeated myth that he had a high-pitched, squeaky voice that ruined his career. Meticulous, comprehensive, and generously illustrated, this book provides a behind-the-scenes look at one of the silent era's greatest stars and the glamorous yet brutal world in which he lived.

The development and increasingly widespread deployment of high-throughput experimental methods in the life sciences is giving rise to numerous large, complex and valuable data resources. This foundation of experimental data underpins the systematic study of organisms and diseases, which increasingly depends on the development of models of biological systems. The development of these models often requires integration of diverse experimental data resources; once constructed, the models themselves become data and present new integration challenges for tasks such as interpretation, validation and comparison. The Data Integration in the Life Sciences (DILS) Conference series brings together data and knowledge management researchers from the computer science research community with bioinformaticians and computational biologists, to improve the understanding of how emerging data integration techniques can address requirements identified in the life sciences. DILS 2010 was the seventh event in the series and was held in Gothenburg, Sweden during August 25-27, 2010. The associated proceedings contain 14 peer-reviewed papers and 2 invited papers. The sessions addressed ontology engineering, and in particular, evolution, matching and debugging of ontologies, a key component for semantic integration; Web services as an important technology for data integration in the life sciences; data

and text mining techniques for discovering and recognizing biomedical entities and relationships between these entities; and information management, introducing data integration solutions for different types of applications related to cancer, systems biology and - croarray experimental data, and an approach for integrating ranked data in the life sciences.

This book constitutes the refereed proceedings of the 8th International Conference on Data Integration in the Life Sciences, DILS 2012, held in College Park, MD, USA, on June 28-29, 2012. The 11 revised papers included in this volume were carefully reviewed and selected. The papers cover the following topics: foundations of data integration, new paradigms for data integration, and integrating clinical data.
