The Model Engineer and Amateur Electrician

This book explains the foundation of approximate Bayesian computation (ABC), an approach to Bayesian inference that does not require the specification of a likelihood function. As a result, ABC can be used to estimate posterior distributions of parameters for simulation-based models. Simulation-based models are now very popular in cognitive science, as are Bayesian methods for performing parameter inference. As such, the recent developments of likelihood-free techniques are an important advancement for the field. Chapters discuss the philosophy of Bayesian inference as well as provide several algorithms for performing ABC. Chapters also apply some of the algorithms in a tutorial fashion, with one specific application to the Minerva 2 model. In addition, the book discusses several applications of ABC methodology to recent problems in cognitive science. Likelihood-Free Methods for Cognitive Science will be of interest to researchers and graduate students working in experimental, applied, and cognitive science.

Laminar free convection from an isothermal, vertical flat plate has been studied for water close to its critical point, a condition in which there are marked variations in density and specific heat. Similarity methods were applied to the laminar, two-dimensional boundary layer equations so that the could subsequently be integrated on a digital computer for various water states.

Authored by veteran author John Baechtel, COMPETITION ENGINE BUILDING stands alone as a premier guide for enthusiasts and students of the racing engine. It will also find favor as a reference guide for experienced professionals for years to come.

Practical Engineer

This book is a self-contained introduction to all aspects of microelectronic (IC) testing. It includes the theory necessary for advanced students as well as reference to industrial practice and economics that will interest designers in industry. Chapters cover both digital circuit testing and the growing area of mixed circuits, used particularly in signal processing.

Arithmetic Built-In Self-Test for Embedded Systems offers a thorough treatment of the important issues in software-based

built-in self-test for systems with embedded processors. Fundamental concepts are illustrated with practical scenarios for test generation, test application, and test response compaction. Arithmetic Built-In Self-Test for Embedded Systems uses an approach to cutting-edge technology that will be of interest to hardware and embedded system designers, test and design engineers, and researchers working on IC/core testing. It is also appropriate for graduate-level design courses. An introductory chapter provides a comprehensive tutorial covering the most relevant DFT and BIST techniques.

The simulation of complex, integrated engineering systems is a core tool in industry which has been greatly enhanced by the MATLAB® and Simulink® software programs. The second edition of Dynamic Systems: Modeling, Simulation, and Control teaches engineering students how to leverage powerful simulation environments to analyze complex systems. Designed for introductory courses in dynamic systems and control, this textbook emphasizes practical applications through numerous case studies—derived from top-level engineering from the AMSE Journal of Dynamic Systems. Comprehensive yet concise chapters introduce fundamental concepts while demonstrating physical engineering applications. Aligning with current industry practice, the text covers essential topics such as analysis, design, and control of physical engineering systems, often composed of interacting mechanical, electrical, and fluid subsystem components. Major topics include

mathematical modeling, system-response analysis, and feedback control systems. A wide variety of end-of-chapter problems—including conceptual problems, MATLAB® problems, and Engineering Application problems—help students understand and perform numerical simulations for integrated systems.
